## CNATIONAL UNIVERSITY OF LESOTHO <br> B.A SUPPLEMENTARY EXAMINATIONS EC3305: INTRODUCTORY ECONOMETRICS I

## INSTRUCTION:

Answer ANY four Questions

## Question 1

a. Regression analysis can be used to test whether the market efficiently uses information in valuing stocks. For concreteness, let return be the total return from holding a firm's stock over the four-year period from the end of 1990 to the end of 1994. The efficient market hypothesis says that these returns should not be systematically related to the information known in 1990. If firm characteristics known at the beginning of the period help to predict stock returns, then we could use this information in choosing stocks. For 1990, let $d k r$ be a firm's debt-to-capital ratio, let eps denote the earnings per share, let netinc denote net income, and let salary denote total compensation for the CEO.

The following equation was estimated:

$$
\begin{gathered}
\text { return }=-14.37+0.321 \mathrm{dkr}+0.043 \text { eps }-0.0051 \text { netinc }+0.0035 \text { salary } \\
(6.89) \quad(0.201) \quad(0.078) \quad(0.0047) \\
\quad n=142, \quad R^{2}=0.0395 .
\end{gathered}
$$

i. Test whether the explanatory variables are jointly significant at the $5 \%$ level. Is any explanatory variable individually significant?
ii. Now, re-estimate the model using the $\log$ form for netinc and salary:

$$
\begin{align*}
\text { return }=-36.30+0.327 d k r+0.069 \text { eps }-4.74 \log (\text { netinc })+7.24 \log (\text { salary }) \\
(39.37) \quad(0.203) \quad(0.080) \quad R^{2}=0.0330 . \tag{6.31}
\end{align*}
$$

Do any of your conclusions from part (i.) change?
b. Consider the estimated equation, which can be used to study the effects of skipping class on college GPA:

$$
\begin{gathered}
\widehat{\operatorname{colGP} A=} 1.39+0.412 h s G P A+0.015 \text { ACT }-0.083 \text { skipped } \\
\quad(0.33) \quad(0.094) \\
\left.n=141, \quad R^{2}=0.011\right)
\end{gathered}
$$

i. Using the standard normal approximation, find the $95 \%$ confidence interval for $\beta_{\text {hSGPA }}$.
ii. Can you reject the hypothesis $H_{0}: \beta_{h s G P A}=0.4$ against the two-sided alternative at the 5\% level? Explain.
iii. Can you reject the hypothesis $H_{0}: \beta_{h s G P A}=1$ against the two-sided alternative at the $5 \%$ level? Explain.

## Question 2

a. Differentiate between applied econometrics and theoretical econometrics.
b. Differentiate between experimental and observational data.
c. Explain and give an example of the three types of observational data.
d. Define and explain six classical assumptions of the regression model.

## Question 3

a. Given the following joint density function,

$$
f(x, y)=\left\{\begin{aligned}
\frac{3}{16} y^{2} x, & \text { for } 0<x<2,0 \leq y \leq 2 \\
0, & \text { otherwise }
\end{aligned}\right.
$$

i. Find the conditional joint density function for $x$ given $y$
ii. Find the conditional joint density function for $y$ given $x$
iii. For $f(x, y)=\frac{3}{16} y^{2} x$, can you say $x$ and $y$ are independent? Explain.
b. Consider the following joint probability table,

Table 1: Joint Probability Table

| $\boldsymbol{Y}$ | $\boldsymbol{X}$ |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | $\mathbf{1}$ | $\boldsymbol{2}$ | $\boldsymbol{f}(\boldsymbol{Y})$ |  |
| $\mathbf{1}$ | 0.25 | 0 | $\mathbf{3}$ |  |
| 2 | 0.05 | 0.05 | 0.10 | 0.35 |
| 3 | 0 | 0.05 | 0.20 | 0.20 |
| 4 | 0 | 0 | 0.25 |  |
| $f(X)$ | 0.30 | 0.10 | 0.60 | 0.20 |

i. Calculate the covariance of $X$ and $Y$
ii. Find the correlation coefficient $\operatorname{Corr}(X, Y)$
c. Consider a basketball player shooting two free throws. Let X be the Bernoulli random variable equal to one if she or he makes the first free throw, and zero otherwise. Let Y be a Bernoulli random variable equal to one if he or she makes the second free throw.
i. Suppose that he or she is an $80 \%$ free throw shooter so that $P(X=1)=$ $P(Y=1)=0.80$. What is the probability of the player making both free throws?
ii. Now assume the following conditional densities, which means that the probability of the player making the second free throw depends on whether the first free throw was made. Thus, if the first free throw is made, the chance of making the second is 0.85 ; if the first free throw is missed, the chance of making the second is 0.70 .

$$
\begin{aligned}
& f_{Y \mid X}(1 \mid 1)=.85, f_{Y \mid X}(0 \mid 1)=.15 \\
& f_{Y \mid X}(1 \mid 0)=.70, f_{Y \mid X}(0 \mid 0)=.30 .
\end{aligned}
$$

Assume further that the probability of making the first free throw is 0.8 , that is, $P(X=1)=$ 0.8 . What is the probability of the player making both free throws?

## Question 4

a. The height of adult males is Normally distributed with mean height $\mu=174 \mathrm{~cm}$ and standard deviation $\sigma=9.6 \mathrm{~cm}$.
i. Let $\boldsymbol{x}$ represent the height of adult males; What is the probability that a randomly selected man is taller than 180 cm ?
ii. Suppose that, from the population of adult males, a random sample of size $n=$ 36 is taken, which yielded an average height of 180 cm . Find the $95 \%$ confidence interval for $\mu$ and interpret.
b. The following table contains eight college students' ACT scores and their GPA (grade point average). The grade point average is based on a four-point scale and has been rounded to one digit after the decimal.

Table 2: College students' ACT scores and their GPA

| Student | $\boldsymbol{G P A}$ | $\boldsymbol{A C T}$ |
| :---: | :---: | :---: |
| 1 | 2.8 | 21 |
| 2 | 3.4 | 24 |
| 3 | 3.0 | 26 |
| 4 | 3.5 | 27 |
| 5 | 3.6 | 29 |
| 6 | 3.0 | 25 |
| 7 | 2.7 | 25 |
| 8 | 3.7 | 30 |

i. Estimate the impact of ACT on GPA using OLS. Interpret your results.
ii. How much of the variation in GPA for these eight students is explained by ACT? Explain.

## Question 5

a. From the estimation of a demand equation for the gasoline market (with $n=36$ ) and standard errors in parenthesis

$$
\begin{align*}
\ln (G / \text { pop })= & -7.737-0.0591 \ln P G+1.3733 \ln \text { income }-0.1268 \ln P n c-0.1187 \ln P u c \\
& (0.6749) \quad(0.03248) \quad(0.075628) \tag{0.081337}
\end{align*}
$$

i. Find the $95 \%$ critical value from the t -distribution.
ii. Find the $95 \%$ confidence interval for $\beta_{\text {inc }}$.
iii. Is demand for gasoline income inelastic?
b. Let $X_{1}, X_{2}$, and $X_{3}$ be the numbers of small, medium, and large pizzas, respectively, sold during the day at Mountain Lounge. These are random variables with expected values $E\left(X_{1}\right)=25, E\left(X_{2}\right)=57$, and $E\left(X_{3}\right)=40$. The prices of the small, medium, and large pizzas are M5.50, M7.60, and M9.15. What is the expected revenue from sales of pizza?

## Question 6

The following model is a simplified version of the multiple regression model used by Biddle and Hamermesh (1990) to study the trade-off between time spent sleeping and working and to look at other factors affecting sleep:

$$
\text { sleep }=\beta_{0}+\beta_{1} \text { totwrk }+\beta_{2} \text { educ }+\beta_{3} \text { age }+u
$$

where sleep and totwrk (total work) are measured in minutes per week and educ and age are measured in years.
a. If adults trade off sleep for work, what is the sign of $\beta_{1}$ ?
b. What signs do you think $\beta_{2}$ and $\beta_{3}$ will have?
c. Given the estimated equation is;

$$
\begin{gathered}
\widehat{\text { seep }}_{i}=3,638.25-0.148 \text { totwrk }_{i}-11.13 \text { educ }_{i}+2.20 \text { age }_{i} \\
n=706, \quad R^{2}=0.113 .
\end{gathered}
$$

If someone works five more hours per week, by how many minutes is sleep predicted to fall? Is this a large trade-off?
d. Discuss the sign and magnitude of the estimated coefficient on educ.
e. Would you say totwrk, educ, and age explain much of the variation in sleep?
f. What other factors might affect the time spent sleeping? Are these likely to be correlated with totwrk?

## Normal Distribution

Table C-1. Cumulative Probabilities of the Standard Normal Distribution.

Entry is area $A$ under the standard normal curve from $-\infty$ to $z(A)$
